Parliament and of the Council of 9
March 2011

MEMBER OF EOTA

European Technical Assessment ETA-12/0354 09/03/2017

I General Part

Technical Assessment Body issuing the ETA and designated according to Article 29 of the Regulation (EU) No 305/2011: ETA-Danmark A/S

Trade name of the construction product:

BeFIX SK, BeFIX TK, BeFIX TKD and BeFIX HVV

Product family to which the above construction product belongs:

Screws for use in timber constructions

Manufacturer:

Joh. Friedrich Behrens AG
Bogenstr.43 – 45
DE-22926 Ahrensburg
Tel. +49 04102/78-0
Fax +49 04102/78-250
Internet www.bea-group.com

Manufacturing plant:

Herstellwerk 14, Herstellwerk 15, Herstellwerk 16,
Herstellwerk 17

This European Technical Assessment contains:

24 pages including 3 annexes which form an integral part of the document

This European Technical Assessment is issued in accordance with Regulation (EU) No 305/2011, on the basis of:

European Assessment document (EAD) no. EAD 130118-00-0603 “Screws for timber constructions”

This version replaces:

The previous ETA with the same number issued on 2013-06-26

Translations of this European Technical Assessment in other languages shall fully correspond to the original issued document and should be identified as such.

Communication of this European Technical Assessment, including transmission by electronic means, shall be in full (excepted the confidential Annex(es) referred to above). However, partial reproduction may be made, with the written consent of the issuing Technical Assessment Body. Any partial reproduction has to be identified as such.

II SPECIFIC PART OF THE EUROPEAN TECHNICAL ASSESSMENT

1 Technical description of product and intended use

Technical description of the product

BeFIX SK, BeFIX TK, BeFIX TKD and BeFIX HVV screws are self-tapping screws to be used in timber structures. The BeFIX SK, BeFIX TK and BeFIX TKD screws shall be threaded over a part of the length. BeFIX HVV screws shall be threaded over the full length.. The screws shall be produced from carbon steel wire for nominal diameters of 3,5 mm to 12,0 mm. Where corrosion protection is required, the material or coating shall be declared in accordance with the relevant specification given in Annex A of EN 14592.

Geometry and Material

The nominal diameter (outer thread diameter), d , shall not be less than 3,5 mm and shall not be greater than 12,0 mm. The overall length, L , of screws shall not be less than 25 mm and shall not be greater than 600 mm. Other dimensions are given in Annex A.

The ratio of inner thread diameter to outer thread diameter d_i/d ranges from 0,57 to 0,72.

The screws are threaded over a minimum length ℓ_g of $4 \cdot d$ (i.e. $\ell_g \geq 4 \cdot d$).

The lead p (distance between two adjacent thread flanks) ranges from $0,38 \cdot d$ to $0,97 \cdot d$.

No breaking shall be observed at a bend angle, α , of less than $(45/d^{0.7} + 20)$ degrees.

2 Specification of the intended use in accordance with the applicable EAD

The screws are used for connections in load bearing timber structures between members of solid timber (softwood), glued laminated timber, cross-laminated timber, and laminated veneer lumber, similar glued members, wood-based panels or steel.

Furthermore, BeFIX screws with diameters between 6 mm and 12 mm may also be used for the fixing of thermal insulation on rafters.

Steel plates and wood-based panels except solid wood panels and cross laminated timber shall only be located on the side of the screw head. The following wood-based panels may be used:

- Plywood according to EN 636 or ETA
- Particleboard according to EN 312 or ETA

- Oriented Strand Board, Type OSB/3 and OSB/4 according to EN 300 or ETA
- Fibreboard according to EN 622-2 and 622-3 or ETA (minimum density 650 kg/m³)
- Cement bonded particleboard
- Solid wood panels according to EN 13353 and EN 13986 and cross laminated timber according to ETA
- Laminated Veneer Lumber, LVL
- Engineered wood products according to ETA, provided that the ETA for the product provides provisions for the use of self-tapping screws and these provisions are applied

The screws shall be driven into the wood without pre-drilling or after pre-drilling with a diameter not larger than the inner thread diameter for the length of the threaded part and with a maximum of the smooth shank diameter for the length of the smooth shank.

The screws are intended to be used in timber connections for which requirements for mechanical resistance and stability and safety in use in the sense of the Basic Works Requirements 1 and 4 of Regulation 305/2011 (EU) shall be fulfilled.

The design of the connections shall be based on the characteristic load-carrying capacities of the screws. The design capacities shall be derived from the characteristic capacities in accordance with Eurocode 5 or an appropriate national code.

The screws are intended for use for connections subject to static or quasi static loading.

Section 3.11 of this ETA contains the corrosion protection for BeFIX screws made from carbon steel.

The scope of the screws regarding resistance to corrosion shall be defined according to national provisions that apply at the installation site considering environmental conditions.

The provisions made in this European Technical Assessment are based on an assumed intended working life of the screws of 50 years.

The indications given on the working life cannot be interpreted as a guarantee given by the producer or Assessment Body, but are to be regarded only as a means for choosing the right products in relation to the expected economically reasonable working life of the works.

3 Performance of the product and references to the methods used for its assessment

Characteristic	Assessment of characteristic
3.1 Mechanical resistance and stability*) (BWR1)	
Tensile strength Screws made of carbon steel	Characteristic value $f_{\text{tens},k}$: Screw d = 3,5 mm: 3,8 kN Screw d = 4,0 mm: 5,0 kN Screw d = 4,5 mm: 6,4 kN Screw d = 5,0 mm: 7,9 kN Screw d = 6,0 mm: 11 kN Screw d = 8,0 mm: 20 kN Screw d = 10,0 mm: 28 kN Screw d = 12,0 mm: 25 kN
Insertion moment	Ratio of the characteristic torsional strength to the mean insertion moment: $f_{\text{tor},k} / R_{\text{tor,mean}} \geq 1,5$
Torsional strength Screws made of carbon steel	Characteristic value $f_{\text{tor},k}$: Screw d = 3,5 mm: 2,0 Nm Screw d = 4,0 mm: 3,0 Nm Screw d = 4,5 mm: 4,2 Nm Screw d = 5,0 mm: 5,6 Nm Screw d = 6,0 mm: 9,5 Nm Screw d = 8,0 mm: 22 Nm Screw d = 10,0 mm: 40 Nm Screw d = 12,0 mm: 42 Nm
3.2 Safety in case of fire (BWR2)	
Reaction to fire	The screws are made from steel classified as performance class A1 of the characteristic reaction to fire, in accordance with the provisions of EC decision 96/603/EC, amended by EC Decision 2000/605/EC.
3.3 Hygiene, health and the environment (BWR3)	
Influence on air quality	The product does not contain/release dangerous substances specified in TR 034, dated October 2015 **)
3.7 Sustainable use of natural resources (BR7)	No Performance Determined
3.8 General aspects related to the performance of the product	The screws have been assessed as having satisfactory durability and serviceability when used in timber structures using the timber species described in Eurocode 5 and subject to the conditions defined by service classes 1 and 2
Identification	See Annex A

*) See additional information in section 3.9 – 3.12.

**) In addition to the specific clauses relating to dangerous substances contained in this European technical Assessment, there may be other requirements applicable to the products falling within its scope (e.g. transposed European legislation and national laws, regulations and administrative provisions). In order to meet the provisions of the Construction Products Regulation, these requirements need also to be complied with, when and where they apply.

3.9 Mechanical resistance and stability

The load-carrying capacities for BeFIX screws are applicable to the wood-based materials mentioned in paragraph 1 even though the term timber has been used in the following.

The characteristic lateral load-carrying capacities and the characteristic axial withdrawal capacities of BeFIX screws should be used for designs in accordance with Eurocode 5 or an appropriate national code.

For screws arranged under an angle between screw axis and grain direction $\alpha \leq 15^\circ$, the minimum threaded penetration length is: $\ell_{ef} \geq \min(4 \cdot d / \sin \alpha; 20 \cdot d)$. For $15^\circ < \alpha \leq 90^\circ$ the minimum threaded must be $\ell_{ef} \geq 4 \cdot d$. For the fixing of rafters, point side penetration must be at least 40 mm, $\ell_{ef} \geq 40$ mm.

ETA's for structural members or wood-based panels must be considered where applicable.

Lateral load-carrying capacity

The characteristic lateral load-carrying capacity of BeFIX screws shall be calculated according to Eurocode 5 using the outer thread diameter d as the nominal diameter of the screw. The contribution from the rope effect may be considered.

For steel-to-timber connections with BeFIX HVV screws $d = 5$ mm, a thick steel plate may be assumed for steel plate thickness $t \geq 2,0$ mm.

The characteristic yield moment shall be calculated from:

BeFIX screws for $3,5 \text{ mm} \leq d \leq 10,0 \text{ mm}$ made of carbon steel:

$$M_{y,k} = 0,15 \cdot 600 \cdot d^{2,6} \quad [\text{Nmm}]$$

BeFIX screws:

$$\text{Screw } d = 12,0 \text{ mm:} \quad 40000 \quad [\text{Nmm}]$$

where

d outer thread diameter [mm]

The embedding strength for screws in non-pre-drilled holes arranged at an angle between screw axis and grain direction, $0^\circ \leq \alpha \leq 90^\circ$ is:

$$f_{h,k} = \frac{0,082 \cdot \rho_k \cdot d^{-0,3}}{2,5 \cdot \cos^2 \alpha + \sin^2 \alpha} \quad [\text{N/mm}^2]$$

and accordingly for screws in pre-drilled holes:

$$f_{h,k} = \frac{0,082 \cdot \rho_k \cdot (1 - 0,01 \cdot d)}{2,5 \cdot \cos^2 \alpha + \sin^2 \alpha} \quad [\text{N/mm}^2]$$

Where

ρ_k characteristic timber density [kg/m^3];

d outer thread diameter [mm];

α angle between screw axis and grain direction.

The embedding strength for screws arranged parallel to the plane of cross laminated timber, independent of the angle between screw axis and grain direction, $0^\circ \leq \alpha \leq 90^\circ$, may be calculated from:

$$f_{h,k} = 20 \cdot d^{-0,5} \quad [\text{N/mm}^2]$$

Where

d outer thread diameter [mm]

The embedding strength for screws in the wide face of cross laminated timber should be assumed as for solid timber based on the characteristic density of the outer layer. If relevant, the angle between force and grain direction of the outer layer should be taken into account.

The direction of the lateral force shall be perpendicular to the screw axis and parallel to the wide face of the cross laminated timber.

Axial withdrawal capacity

The characteristic axial withdrawal capacity of BeFIX screws in solid timber (softwood), glued laminated timber or cross-laminated timber members at an angle of $0^\circ \leq \alpha \leq 90^\circ$ to the grain shall be calculated from:

$$F_{ax,\alpha,Rk} = n_{ef} \cdot k_{ax} \cdot f_{ax,k} \cdot d \cdot \ell_{ef} \cdot \left(\frac{\rho_k}{350} \right)^{0,8} \quad [\text{N}]$$

Where

$F_{ax,\alpha,Rk}$ characteristic withdrawal capacity of the group of screw at an angle α to the grain [N]

n_{ef} effective number of screws according to Eurocode 5

k_{ax} $k_{ax} = 1,0$ for $45^\circ \leq \alpha \leq 90^\circ$

$k_{ax} = 0,3 + \frac{0,7 \cdot \alpha}{45^\circ}$ for $0^\circ \leq \alpha < 45^\circ$

$f_{ax,k}$ Characteristic withdrawal parameter

Screw $d = 3,5$ mm: $f_{ax,k} = 13,3 \text{ N/mm}^2$

Screw $d = 4,0$ mm: $f_{ax,k} = 12,9 \text{ N/mm}^2$

Screw $d = 4,5$ mm: $f_{ax,k} = 12,5 \text{ N/mm}^2$

Screw $d = 5,0$ mm: $f_{ax,k} = 12,1 \text{ N/mm}^2$

Screw $d = 6,0$ mm: $f_{ax,k} = 11,4 \text{ N/mm}^2$

Screw $d = 8,0$ mm: $f_{ax,k} = 11,1 \text{ N/mm}^2$

Screw $d \geq 10,0$ mm: $f_{ax,k} = 10,8 \text{ N/mm}^2$

d outer thread diameter [mm]

ℓ_{ef} point side penetration length of the threaded part according to Eurocode 5 [mm]

α angle between grain and screw axis

ρ_k characteristic density [kg/m^3]

For screws arranged under an angle between screw axis and grain direction $\alpha \leq 15^\circ$, the minimum threaded penetration length is: $\ell_{ef} \geq \min(4 \cdot d / \sin \alpha; 20 \cdot d)$. For $15^\circ < \alpha \leq 90^\circ$ the minimum threaded penetration length must be $\ell_{ef} \geq 4 \cdot d$

For screws penetrating more than one layer of cross laminated timber, the different layers may be taken into account proportionally.

The axial withdrawal capacity is limited by the head pull-through capacity and the tensile or compressive capacity of the screw.

Bending angle

A minimum plastic bending angle of $45^\circ/d^{0.7} + 20^\circ$ was reached without breaking the screws.

Head pull-through capacity

The characteristic head pull-through capacity of BeFIX screws shall be calculated according to Eurocode 5 from:

$$F_{ax,\alpha,Rk} = n_{ef} \cdot f_{head,k} \cdot d_h^2 \cdot \left(\frac{\rho_k}{350} \right)^{0.8} \quad [N]$$

where:

$F_{ax,\alpha,Rk}$	characteristic head pull-through capacity of the connection at an angle $\alpha \geq 30^\circ$ to the grain [N]
n_{ef}	effective number of screws according to Eurocode 5
$f_{head,k}$	characteristic head pull-through parameter [N/mm ²]
d_h	diameter of the screw head [mm]
ρ_k	characteristic density [kg/m ³], for wood-based panels $\rho_k = 380 \text{ kg/m}^3$

Characteristic head pull-through parameter for BeFIX screws in connections with timber and in connections with wood-based panels with thicknesses above 20 mm:

$$f_{head,k} = 12,0 \text{ N/mm}^2$$

Characteristic head pull-through parameter for BeFIX screws in connections with wood-based panels with thicknesses between 12 mm and 20 mm:

$$f_{head,k} = 8 \text{ N/mm}^2$$

Screws in connections with wood-based panels with a thickness below 12 mm (minimum thickness of the wood based panels of $1,2 \cdot d$ with d as outer thread diameter):

$$f_{head,k} = 8 \text{ N/mm}^2$$

limited to $F_{ax,Rk} = 400 \text{ N}$

The head diameter d_h shall be greater than $1,8 \cdot d_s$, where d_s is the smooth shank or the wire diameter. Otherwise the characteristic head pull-through capacity $F_{ax,\alpha,Rk} = 0$.

The minimum thickness of wood-based panels according to the clause 2.1 must be observed.

In steel-to-timber connections the head pull-through capacity may be disregarded.

Tensile capacity

The characteristic tensile strength $f_{tens,k}$ of BeFIX screws is:

Screw $d = 3,5 \text{ mm}$:	3,8 kN
Screw $d = 4,0 \text{ mm}$:	5,0 kN
Screw $d = 4,5 \text{ mm}$:	6,4 kN

Screw $d = 5,0 \text{ mm}$:	7,9 kN
Screw $d = 6,0 \text{ mm}$:	11 kN
Screw $d = 8,0 \text{ mm}$:	20 kN
Screw $d = 10,0 \text{ mm}$:	28 kN
Screw $d = 12,0 \text{ mm}$:	25 kN

For screws used in combination with steel plates, the tear-off capacity of the screw head should be greater than the tensile strength of the screw.

Thermal insulation material on top of rafters

See annex C

Combined laterally and axially loaded screws

For screwed connections subjected to a combination of axial and lateral load, the following expression should be satisfied:

$$\left(\frac{F_{ax,Ed}}{F_{ax,Rd}} \right)^2 + \left(\frac{F_{la,Ed}}{F_{la,Rd}} \right)^2 \leq 1$$

where

$F_{ax,Ed}$	axial design load of the screw
$F_{la,Ed}$	lateral design load of the screw
$F_{ax,Rd}$	design load-carrying capacity of an axially loaded screw
$F_{la,Rd}$	design load-carrying capacity of a laterally loaded screw

3.11 Aspects related to the performance of the product

3.11.1 Corrosion protection in service class 1 and 2.

The BeFIX screws with nominal diameters of 3,5 mm to 12,0 mm are produced from carbon wire. Screws made from carbon steel are electrogalvanised or otherwise coated appropriate for the expected working life and service class. The mean thickness of the zinc coating is $5\mu\text{m}$.

3.12 General aspects related to the intended use of the product

The screws are manufactured in accordance with the provisions of the European Technical Assessment using the automated manufacturing process and laid down in the technical documentation.

The installation shall be carried out in accordance with Eurocode 5 or an appropriate national code unless otherwise is defined in the following. Instructions from Joh. Friedrich Behrens AG should be considered for installation.

The screws are used for connections in load bearing timber structures between members of solid timber (softwood), glued laminated timber, cross-laminated timber, and laminated veneer lumber, similar glued members, wood-based panels or steel members.

The screws may be used for connections in load bearing timber structures with structural members according to an associated ETA, if according to the associated ETA of the structural member a connection in load bearing timber structures with screws according to a ETA is allowed.

Furthermore, the screws with diameters of at least 6 mm may also be used for the fixing of insulation on top of rafters.

A minimum of two screws should be used for connections in load bearing timber structures.

Wood-based panels and steel plates should only be arranged on the side of the screw head. The minimum thickness of wood-based panels should be $1,2 \cdot d$. Furthermore the minimum thickness for following wood-based panels should be:

- Plywood, Fibreboards: 6 mm
- Particleboards, OSB, Cement Particleboards: 8 mm
- Solid wood panels: 12 mm

For structural members according to ETA's the terms of the ETA's must be considered.

If screws with an outer thread diameter $d \geq 8$ mm are used in load bearing timber structures, the structural solid or glued laminated timber, laminated veneer lumber and similar glued members must be from spruce, pine or fir. This does not apply for screws in pre-drilled holes.

The minimum angle between the screw axis of screws is $0^\circ \leq \alpha \leq 90^\circ$.

The screws shall be driven into the wood with or without pre-drilling. The maximum pre-drilling diameter is the inner thread diameter for the length of the threaded part and the smooth shank diameter for the depth of the smooth shank.

The hole diameter in steel members must be predrilled with a suitable diameter.

Only the equipment prescribed by Joh. Friedrich Behrens AG shall be used for driving the screws.

In connections with screws with countersunk head according to Annex A the head must be flush with the surface of the connected structural member. A deeper countersink is not allowed.

For structural timber members, minimum spacing and distances for screws in predrilled holes are given in Eurocode 5 clause 8.3.1.2 and table 8.2 as for nails in predrilled holes. Here, the outer thread diameter d must be considered.

For screws in non-predrilled holes, minimum spacing and distances are given in Eurocode 5 clause 8.3.1.2 and table 8.2 as for nails in non-predrilled holes.

For Douglas fir members minimum spacing and distances parallel to the grain shall be increased by 50%.

Minimum distances from loaded or unloaded ends must be $15 \cdot d$ for screws in non-predrilled holes with outer thread diameter $d \geq 8$ mm and timber thickness $t < 5 \cdot d$.

Minimum distances from the unloaded edge perpendicular to the grain may be reduced to $3 \cdot d$ also for timber thickness $t < 5 \cdot d$, if the spacing parallel to the grain and the end distance is at least $25 \cdot d$.

Minimum distances and spacing for exclusively axially loaded screws in non-predrilled holes in members with a minimum thickness $t = 10 \cdot d$ and a minimum width of $8 \cdot d$ or 60 mm, whichever is the greater, may be taken as:

Spacing a_1 parallel to the grain	$a_1 = 5 \cdot d$
Spacing a_2 perpendicular to the grain	$a_2 = 5 \cdot d$
Distance $a_{1,c}$ from centre of the screw-part in timber to the end grain	$a_{1,c} = 10 \cdot d$
Distance $a_{2,c}$ from centre of the screw-part in timber to the edge	$a_{2,c} = 4 \cdot d$

Spacing a_2 perpendicular to the grain may be reduced from $5 \cdot d$ to $2,5 \cdot d$, if the condition $a_1 \cdot a_2 \geq 25 \cdot d^2$ is fulfilled.

Minimum distances and spacing for exclusively axially loaded screws in predrilled holes in members with a minimum thickness $t = 10 \cdot d$ and a minimum width of $8 \cdot d$ or 60 mm, whichever is the greater, may be taken as:

Spacing a_1 parallel to the grain	$a_1 = 5 \cdot d$
Spacing a_2 perpendicular to the grain	$a_2 = 5 \cdot d$
Distance $a_{1,c}$ from centre of the screw-part in timber to the end grain	$a_{1,c} = 5 \cdot d$
Distance $a_{2,c}$ from centre of the screw-part in timber to the edge	$a_{2,c} = 3 \cdot d$

Spacing a_2 perpendicular to the grain may be reduced from $5 \cdot d$ to $2,5 \cdot d$, if the condition $a_1 \cdot a_2 \geq 25 \cdot d^2$ is fulfilled.

For a crossed screw couple the minimum spacing between the crossing screws is $1,5 \cdot d$.

Minimum thickness for structural members is $t = 24$ mm for screws with outer thread diameter $d < 8$ mm, $t = 30$ mm for screws with outer thread diameter $d = 8$ mm, and $t = 40$ mm for screws with outer thread diameter $d = 10$ mm.

Unless specified otherwise in the technical specification (ETA or hEN) of cross laminated timber, minimum distances and spacing for screws in the wide face of cross laminated timber members with a minimum thickness $t = 10 \cdot d$ may be taken as (see Annex B):

Spacing a_1 parallel to the grain	$a_1 = 4 \cdot d$
Spacing a_2 perpendicular to the grain	$a_2 = 2,5 \cdot d$
Distance $a_{3,c}$ from centre of the screw-part in	

timber to the unloaded end grain	$a_{3,c} = 6 \cdot d$
Distance $a_{3,t}$ from centre of the screw-part in timber to the loaded end grain	$a_{3,t} = 6 \cdot d$
Distance $a_{4,c}$ from centre of the screw-part in timber to the unloaded edge	$a_{4,c} = 2,5 \cdot d$
Distance $a_{4,t}$ from centre of the screw-part in timber to the loaded edge	$a_{4,t} = 6 \cdot d$

Unless specified otherwise in the technical specification (ETA or hEN) of cross laminated timber, minimum distances and spacing for screws in the edge surface of cross laminated timber members with a minimum thickness $t = 10 \cdot d$ and a minimum penetration depth perpendicular to the edge surface of $10 \cdot d$ may be taken as (see Annex B):

Spacing a_1 parallel to the CLT plane	$a_1 = 10 \cdot d$
Spacing a_2 perpendicular to the CLT plane	$a_2 = 4 \cdot d$
Distance $a_{3,c}$ from centre of the screw-part in timber to the unloaded end	$a_{3,c} = 7 \cdot d$
Distance $a_{3,t}$ from centre of the screw-part in timber to the loaded end	$a_{3,t} = 12 \cdot d$
Distance $a_{4,c}$ from centre of the screw-part in timber to the unloaded edge	$a_{4,c} = 3 \cdot d$
Distance $a_{4,t}$ from centre of the screw-part in timber to the loaded edge	$a_{4,t} = 6 \cdot d$

4 Attestation and verification of constancy of performance (AVCP)

4.1 AVCP system

According to the decision 97/176/EC of the European Commission¹, as amended, the system(s) of assessment and verification of constancy of performance (see Annex V to Regulation (EU) No 305/2011) is 3.

5 Technical details necessary for the implementation of the AVCP system, as foreseen in the applicable EAD

Technical details necessary for the implementation of the AVCP system are laid down in the control plan deposited at ETA-Danmark prior to CE marking.

Issued in Copenhagen on 2017-03-09 by

Annex B Minimum distances and spacing

Axially loaded screws
Single configuration

S = centroid of the part of the screw in the timber

Minimum distances and spacings for exclusively axially loaded screws in non-predrilled holes.
Minimum timber thickness $t = 10 \cdot d$, minimum timber width $w = \max \{8 \cdot d; 60 \text{ mm}\}$.
 $a_1 \geq 5 \cdot d$ $a_2 \geq 5 \cdot d$ $a_{1,c} \geq 10 \cdot d$ $a_{2,c} \geq 4 \cdot d$

Minimum distances and spacings for exclusively axially loaded screws in predrilled holes.
Minimum timber thickness $t = 10 \cdot d$, minimum timber width $w = \max \{8 \cdot d; 60 \text{ mm}\}$.
 $a_1 \geq 5 \cdot d$ $a_2 \geq 5 \cdot d$ $a_{1,c} \geq 5 \cdot d$ $a_{2,c} \geq 3 \cdot d$

Spacing a_2 may be reduced from $5 \cdot d$ to $2,5 \cdot d$, if the condition $a_1 \cdot a_2 \geq 25 \cdot d^2$ is fulfilled.

For a crossed screw couple the minimum spacing between the crossing screws is $1,5 \cdot d$.

Minimum distances and spacings, see also 3.12

Axially loaded screws Crosswise configuration

S = centroid of the part of the screw in the timber

Minimum distances and spacings for exclusively axially loaded screws in non-predrilled holes.

Minimum timber thickness $t = 10 \cdot d$, minimum timber width $w = \max \{8 \cdot d; 60 \text{ mm}\}$.

$$a_1 \geq 5 \cdot d \quad a_2 \geq 5 \cdot d \quad a_{1,c} \geq 10 \cdot d \quad a_{2,c} \geq 4 \cdot d$$

Minimum distances and spacings for exclusively axially loaded screws in predrilled holes.

Minimum timber thickness $t = 10 \cdot d$, minimum timber width $w = \max \{8 \cdot d; 60 \text{ mm}\}$.

$$a_1 \geq 5 \cdot d \quad a_2 \geq 5 \cdot d \quad a_{1,c} \geq 5 \cdot d \quad a_{2,c} \geq 3 \cdot d$$

Spacing a may be reduced from $5 \cdot d$ to $2,5 \cdot d$, if the condition $a_1 \cdot a_2 \geq 25 \cdot d^2$ is fulfilled.

For a crossed screw couple the minimum spacing between the crossing screws is $1,5 \cdot d$.

Minimum distances and spacings, see also 3.12

Annex E
Thermal insulation on top of rafters

BeFIX screws with an outer thread diameter $6 \text{ mm} \leq d \leq 12 \text{ mm}$ may be used for the fixing of heat insulation on top of rafters.

The thickness of the insulation shall not exceed 400 mm. The rafter insulation must be placed on top of solid timber or glued laminated timber rafters or cross-laminated timber members and be fixed by battens arranged parallel to the rafters or by wood-based panels on top of the insulation layer. The insulation of vertical facades is also covered by the rules given here.

Screws must be screwed in the rafter through the battens or panels and the insulation without pre-drilling in one sequence.

The angle α between the screw axis and the grain direction of the rafter should be between 30° and 90° .

The rafter consists of solid timber (softwood) according to EN 338, glued laminated timber according to EN 14081, cross-laminated timber, or laminated veneer lumber according to EN 14374 or to European Technical Assessment or similar glued members according to European Technical Assessment.

The battens must be from solid timber (softwood) according to EN 338. The minimum thickness t and the minimum width b of the solid timber battens is given as follows:

Screws $d \leq 8,0 \text{ mm}$:	$b_{\min} = 50 \text{ mm}$	$t_{\min} = 30 \text{ mm}$
Screws $d = 10,0 \text{ mm}$:	$b_{\min} = 60 \text{ mm}$	$t_{\min} = 40 \text{ mm}$
Screws $d = 12,0 \text{ mm}$:	$b_{\min} = 80 \text{ mm}$	$t_{\min} = 100 \text{ mm}$

The insulation must comply with a European Technical Assessment.

Friction forces shall not be considered for the design of the characteristic axial capacity of the screws.

The anchorage of wind suction forces as well as the bending stresses of the battens or the boards, respectively, shall be considered in design. Additional screws perpendicular to the grain of the rafter (angle $\alpha = 90^\circ$) may be arranged if necessary.

The maximum screw spacing is $e_s = 1,75 \text{ m}$.

Thermal insulation on rafters with parallel inclined screws

Mechanical model

The system of rafter, heat insulation material on top of rafter and battens parallel to the rafter may be considered as a beam on elastic foundation. The batten represents the beam, and the heat insulation material on top of the rafter the elastic foundation. The minimum compression stress of the heat insulation material at 10 % deformation, measured according to EN 826¹, shall be $\sigma_{10\%} = 0,05 \text{ N/mm}^2$. The batten is loaded perpendicular to the axis by point loads F_b . Further point loads F_s are from the shear load of the roof due to dead and snow load, which are transferred from the screw heads into the battens.

¹EN 826:1996 Thermal insulating products for building applications - Determination of compression behaviour

Thermal insulation on rafters with parallel inclined screws

Design of the battens

The bending stresses are calculated as:

$$M = \frac{(F_b + F_s) \cdot \ell_{\text{char}}}{4}$$

Where

F_b point loads perpendicular to the battens [N]

F_s point loads perpendicular to the battens, load application in the area of the screw heads [N]

ℓ_{char} characteristic length $\ell_{\text{char}} = \sqrt[4]{\frac{4 \cdot EI}{w_{\text{ef}} \cdot K}}$ [mm]

EI bending stiffness of the batten [$\text{N/mm}^2 \cdot \text{mm}^4$]

w_{ef} effective width of the thermal insulation material [mm]

K coefficient of subgrade

The coefficient of subgrade K may be calculated from the modulus of elasticity E_{HI} and the thickness t_{HI} of the heat insulation material if the effective width w_{ef} of the heat insulation material under compression is known. Due to the load extension in the heat insulation material the effective width w_{ef} is greater than the width of the batten or rafter, respectively. For further calculations, the effective width w_{ef} of the heat insulation material may be determined according to:

$$w_{\text{ef}} = w + t_{\text{HI}}/2$$

Where

w minimum width of the batten or rafter, respectively [mm]

t_{HI} thickness of the heat insulation [mm]

$$K = \frac{E_{\text{HI}}}{t_{\text{HI}}}$$

The following condition shall be satisfied:

$$\frac{\sigma_{\text{m,d}}}{f_{\text{m,d}}} = \frac{M_d}{W \cdot f_{\text{m,d}}} \leq 1$$

For the calculation of the section modulus W of the net cross section has to be considered.

The shear stresses shall be calculated according to:

$$V = \frac{(F_b + F_s)}{2}$$

The following condition shall be satisfied:

$$\frac{\tau_d}{f_{\text{v,d}}} = \frac{1,5 \cdot V_d}{A \cdot f_{\text{v,d}}} \leq 1$$

Design of the heat insulation material

The compressive stresses in the thermal insulation material shall be calculated according to:

$$\sigma = \frac{1,5 \cdot F_b + F_s}{2 \cdot \ell_{\text{char}} \cdot w}$$

The design value of the compressive stress shall not be greater than 110 % of the compressive stress at 10 % deformation calculated according to EN 826.

Thermal insulation on rafters with parallel inclined screws

Design of the screws

Alternatively to the battens, wood-based panels with a minimum thickness of 20 mm from plywood according to EN 636, particle board according to EN 312, oriented strand board OSB/3 and OSB/4 according to EN 300 or European Technical Approval and solid wood panels according to EN 13353 or cross laminated timber may be used.

The insulation must have a minimum compressive stress of $\sigma_{10\%} = 0,05 \text{ N/mm}^2$ at 10 % deformation according to EN 826.

The analysis of the fixing of the insulation and battens or boards, respectively, may be carried out using the static model showed on previous pages. The battens or boards, respectively, must have sufficient strength and stiffness. The maximum design value of the compressive stress between the battens or boards, respectively, and the insulation shall not exceed $1,1 \cdot \sigma_{10\%}$.

The screws are loaded predominantly axially. The axial tension force in the screw may be calculated from the shear loads of the roof R_s :

$$T_s = \frac{R_s}{\cos \alpha}$$

The design axial capacity of the "BeFIX SK" and "BeFIX TK" screws for rafter or facade insulation shall be calculated from:

$$F_{ax,a,Rd} = \min \left\{ k_{ax} \cdot f_{ax,d} \cdot d \cdot \ell_{ef,r} \cdot k_1 \cdot k_2 \cdot \left(\frac{\rho_{k,r}}{350} \right)^{0,8} ; f_{head,d} \cdot d_h^2 \cdot \left(\frac{\rho_{k,b}}{350} \right)^{0,8} ; \frac{f_{tens,k}}{\gamma_{M2}} \right\}$$

The design axial capacity of the "BeFIX TKD" screws for rafter or facade insulation shall be calculated from:

$$F_{ax,a,Rd} = \min \left\{ k_{ax} \cdot f_{ax,d} \cdot d \cdot \ell_{ef,r} \cdot k_1 \cdot k_2 \cdot \left(\frac{\rho_{k,r}}{350} \right)^{0,8} ; \max \left\{ f_{head,d} \cdot d_h^2 ; k_{ax} \cdot f_{ax,d} \cdot d \cdot \ell_{ef,b} \right\} \cdot \left(\frac{\rho_{k,b}}{350} \right)^{0,8} ; \frac{f_{tens,k}}{\gamma_{M2}} \right\}$$

Where

$F_{ax,a,Rd}$ design axial capacity of the screw at an angle α to the grain [N]

$k_{ax} = 1,0$ for $45^\circ \leq \alpha \leq 90^\circ$

$k_{ax} = 0,3 + (0,7 \cdot \alpha/45^\circ)$ for $0^\circ \leq \alpha < 45^\circ$

$f_{ax,d}$ design withdrawal parameter [N/mm²]

d outer thread diameter [mm]

d_h head diameter [mm]

$\ell_{ef,r}$ point side penetration length of the threaded part according to EN 1995-1-1 [mm]

$\ell_{ef,b}$ length of the threaded part in the batten [mm]

α angle between grain and screw axis ($\alpha \geq 30^\circ$)

$k_1 = \min \{1; 220/t_{HI}\}$

$k_2 = \min \{1; \sigma_{10\%}/0,12\}$

If equation k_1 and k_2 are considered, the deflection of the battens does not need to be considered.

t_{HI} thickness of the heat insulation [mm]

$\sigma_{10\%}$ compressive stress of the heat insulation under 10 % deformation [N/mm²]

$\sigma_{10\%} \geq 0,05 \text{ N/mm}^2$

$\rho_{k,r}$ characteristic density of the rafter [kg/m³]

$\rho_{k,b}$ characteristic density of the batten [kg/m³]

$f_{head,d}$ design head pull-through parameter [N/mm²]

$f_{tens,k}$ characteristic tensile capacity [N]

γ_{M2} partial safety factor according to EN 1993-1-1 or according to national annex

Thermal insulation on rafters with parallel inclined screws

Fixing of battens with parallel screws perpendicular to the roof plane

Alternatively to the battens, wood-based panels with a minimum thickness of 20 mm from plywood according to EN 636, particle board according to EN 312, oriented strand board OSB/3 and OSB/4 according to EN 300 or European Technical Assessment and solid wood panels according to EN 13353 or cross laminated timber may be used.

The insulation must have a minimum compressive stress of $\sigma_{10\%} = 0,05 \text{ N/mm}^2$ at 10 % deformation according to EN 826.

The battens or wood-based panels, respectively, must have sufficient strength and stiffness. The maximum design value of the compressive stress between the battens or boards, respectively, and the insulation shall not exceed $1,1 \cdot \sigma_{10\%}$.

The characteristic load-carrying capacity of the screws loaded in shear may be calculated from:

$$F_{v,Rk} = \min \left\{ \begin{array}{l} f_{h,b,k} \cdot d \cdot t_b \\ f_{h,r,k} \cdot d \cdot t_r \\ \frac{f_{h,b,k} \cdot d \cdot \beta}{1 + \beta} \cdot \left(\sqrt{4t_{il}^2 + \left(2 + \frac{1}{\beta}\right)t_b^2 + (2 + \beta)t_r^2 + 4t_{il}(t_b + t_r) + 2t_b t_r - 2t_{il} - t_b - t_r} \right) + \frac{F_{ax,Rk}}{4} \\ 1,05 \cdot \frac{f_{h,b,k} \cdot d \cdot \beta}{\frac{1}{2} + \beta} \cdot \left(\sqrt{t_{il}^2 + t_{il}t_b + \frac{t_b^2}{2}\left(1 + \frac{1}{\beta}\right) + \frac{M_{y,k}}{f_{h,b,k} \cdot d} \left(1 + \frac{2}{\beta}\right) - t_{il} - \frac{t_b}{2}} \right) + \frac{F_{ax,Rk}}{4} \\ 1,05 \cdot \frac{f_{h,b,k} \cdot d \cdot \beta}{\frac{1}{2} + \beta} \cdot \left(\sqrt{t_{il}^2 + t_{il}t_r + \frac{t_r^2}{2}\left(1 + \beta\right) + \frac{M_{y,k}}{f_{h,b,k} \cdot d} \left(2 + \frac{1}{\beta}\right) - t_{il} - \frac{t_r}{2}} \right) + \frac{F_{ax,Rk}}{4} \\ 1,15 \cdot \frac{f_{h,b,k} \cdot d \cdot \beta}{1 + \beta} \cdot \left(\sqrt{\beta^2 t_{il}^2 + 4\beta(\beta + 1) \cdot \frac{M_{y,k}}{f_{h,b,k} \cdot d} - \beta t_{il}} \right) + \frac{F_{ax,Rk}}{4} \end{array} \right.$$

Where

- $f_{h,b,k}$ characteristic batten embedding strength [N/mm²]
- $f_{h,r,k}$ characteristic rafter embedding strength [N/mm²]
- β $f_{h,r,k} / f_{h,b,k}$
- d outer thread diameter [mm]
- t_b batten thickness [mm]
- t_r lower value of rafter thickness or screw penetration length [mm]
- t_{il} interlayer thickness [mm]
- $M_{y,k}$ characteristic fastener yield moment [Nmm]
- $F_{ax,Rk}$ characteristic axial capacity of the screw [N]

Thermal insulation on rafters with alternatively inclined screws

Mechanical model

Depending on the screw spacing and the arrangement of tensile and compressive screws with different inclinations the battens are loaded by significant bending moments. The bending moments are derived based on the following assumptions:

- The tensile and compressive loads in the screws are determined based on equilibrium conditions from the actions parallel and perpendicular to the roof plane. These actions are constant line loads q_{\perp} and q_{\parallel} .
- The screws act as hinged columns supported 10 mm within the batten or rafter, respectively. The effective column length consequently equals the length of the screw between batten and rafter plus 20 mm.
- The batten is considered as a continuous beam with a constant span $\ell = A + B$. The compressive screws constitute the supports of the continuous beam while the tensile screws transfer concentrated loads perpendicular to the batten axis.

The screws are predominantly loaded in withdrawal or compression, respectively. The screw's normal forces are determined based on the loads parallel and perpendicular to the roof plane:

$$\text{compressive screw: } F_{c,Ed} = (A + B) \cdot \left(-\frac{q_{\parallel}}{\cos\alpha_1 + \sin\alpha_1 / \tan\alpha_2} - \frac{q_{\perp} \cdot \sin(90^\circ - \alpha_2)}{\sin(\alpha_1 + \alpha_2)} \right)$$

$$\text{tensile screw: } F_{t,Ed} = (A + B) \cdot \left(\frac{q_{\parallel}}{\cos\alpha_2 + \sin\alpha_2 / \tan\alpha_1} - \frac{q_{\perp} \cdot \sin(90^\circ - \alpha_1)}{\sin(\alpha_1 + \alpha_2)} \right)$$

The bending moments in the batten follow from the constant line load q_{\perp} and the load components perpendicular to the batten from the tensile screws. The span of the continuous beam is $(A + B)$. The load component perpendicular to the batten from the tensile screw is:

$$F_{ZS,Ed} = (A + B) \cdot \left(\frac{q_{\parallel}}{1 / \tan\alpha_1 + 1 / \tan\alpha_2} - \frac{q_{\perp} \cdot \sin(90^\circ - \alpha_1) \cdot \sin\alpha_2}{\sin(\alpha_1 + \alpha_2)} \right)$$

Where

q_{\parallel} constant line load parallel to batten

q_{\perp} constant line load perpendicular to batten

α_1 angle between compressive screw axis and grain direction

α_2 angle between tensile screw axis and grain direction

A positive value for F_{ZS} means a load towards the rafter, a negative value a load away from the rafter.

Thermal insulation on rafters with alternatively inclined screws

Mechanical model

$$\text{compressive screw: } F_{c,Ed} = (A + B) \cdot \left(-\frac{q_{\parallel}}{\cos \alpha_1 + \sin \alpha_1 / \tan \alpha_2} - \frac{q_{\perp} \cdot \sin(90^\circ - \alpha_2)}{\sin(\alpha_1 + \alpha_2)} \right)$$

$$\text{tensile screw: } F_{t,Ed} = (A + B) \cdot \left(\frac{q_{\parallel}}{\cos \alpha_2 + \sin \alpha_2 / \tan \alpha_1} - \frac{q_{\perp} \cdot \sin(90^\circ - \alpha_1)}{\sin(\alpha_1 + \alpha_2)} \right)$$

$$\text{concentrated load: } F_{ZS,Ed} = (A + B) \cdot \left(\frac{q_{\parallel}}{1 / \tan \alpha_1 + 1 / \tan \alpha_2} - \frac{q_{\perp} \cdot \sin(90^\circ - \alpha_1) \cdot \sin \alpha_2}{\sin(\alpha_1 + \alpha_2)} \right)$$

Where

q_{\parallel} constant line load parallel to batten

q_{\perp} constant line load perpendicular to batten

α_1 angle between compressive screw axis and grain direction

α_2 angle between tensile screw axis and grain direction

A positive value for F_{ZS} means a load towards the rafter, a negative value a load away from the rafter.

Thermal insulation on rafters with alternatively inclined screws

Design of the screws

The analysis of the fixing of the insulation and battens may be carried out using the static model showed on previous page. The battens must have sufficient strength and stiffness.

The design axial tensile capacity of the "BeFIX TKD" screws for rafter or facade insulation shall be calculated from:

$$F_{ax,\alpha,Rd} = \min \left\{ \max \left\{ \frac{f_{head,d} \cdot d_h^2}{k_{ax} \cdot f_{ax,d} \cdot d \cdot \ell_{ef,b}} \cdot \left(\frac{\rho_{k,b}}{350} \right)^{0,8} ; k_{ax} \cdot f_{ax,d} \cdot d \cdot \ell_{ef,r} \cdot \left(\frac{\rho_{k,r}}{350} \right)^{0,8} ; \frac{f_{tens,k}}{\gamma_{M2}} \right\} \right\}$$

The design axial compressive capacity of the "BeFIX TKD" screws for rafter or facade insulation shall be calculated from:

$$F_{ax,\alpha,Rd} = \min \left\{ k_{ax} \cdot f_{ax,d} \cdot d \cdot \ell_{ef,b} \cdot \left(\frac{\rho_{k,b}}{350} \right)^{0,8} ; k_{ax} \cdot f_{ax,d} \cdot d \cdot \ell_{ef,r} \cdot \left(\frac{\rho_{k,r}}{350} \right)^{0,8} ; \frac{F_{ki,Rk}}{\gamma_{M1}} \right\}$$

Where

$F_{ax,\alpha,Rd}$	design axial capacity of the screw at an angle α to the grain [N]
$f_{head,d}$	design head pull-through parameter [N/mm ²]
d_h	head diameter [mm]
k_{ax}	= 1,0 for $45^\circ \leq \alpha \leq 90^\circ$ = $0,3 + (0,7 \cdot \alpha / 45^\circ)$ for $0^\circ \leq \alpha < 45^\circ$
$f_{ax,d}$	design withdrawal parameter [N/mm ²]
d	outer thread diameter [mm]
$\ell_{ef,b}$	length of the threaded part in the batten [mm]
$\ell_{ef,r}$	point side penetration length of the threaded part according to EN 1995-1-1 [mm]
α	angle between grain and screw axis ($\alpha \geq 30^\circ$)
$\rho_{k,b}$	characteristic density of the batten [kg/m ³]
$\rho_{k,r}$	characteristic density of the rafter [kg/m ³]
$f_{tens,k}$	characteristic tensile capacity [N]
$F_{ki,Rk}$	characteristic compressive capacity depending on free screw length between counter batten and rafter [N]
γ_{M1}, γ_{M2}	partial safety factor according to EN 1993-1-1 or according to national annex

Free screw length [mm]	BeFIX TKD
